AWS Security

Re: Sr. Technical Program Manager – Bug Bounty

Dear AWS Security Team,

For the past 11 years, I've served as the point person for security and bug report intake at SpiderOak, a secure backup and collaboration provider supporting government and enterprise clients. While I haven't run a formal bug bounty program, I've spent over a decade receiving reports, reproducing issues, coordinating fixes, and tracking remediation—often acting as the connective tissue between researchers, engineers, and decision-makers.

What excites me about this role is its blend of technical analysis, program leadership, and community interaction. I've worked closely with security-conscious customers and engineering teams to improve response workflows, build trust after incidents, and write the automation that keeps things moving. I know how to ask the right questions when a report comes in, and how to communicate both impact and urgency—upward, downward, and outward.

I appreciate that AWS is looking for someone who's not just technically fluent, but also thoughtful about relationships—with researchers, stakeholders, and customers. That's the kind of work I find most meaningful. And it's why I'd love to be part of a team raising the bar for public-facing security programs at global scale.

If my background looks like a fit, I'd be happy to continue the conversation.

Warmly,
Adam Tervort
